

Spout 2.007

Spout 2.007 is a portable installation containing the latest versions of utility programs for setup and testing. The applications do not require a Spout installation.

Installation

After extracting the downloaded zip file, you will find a 'SPOUT-2007' folder that can be moved to any location (although avoid folders that require administrator privileges).

After moving this folder to a permanent location, you will need to initialize Spout with the following steps:

1. Settings

Run <SPOUTSETTINGS/SpoutSettings.exe>.

- If a Spout installation is detected, you have the option of removing it. If you do not receive a message that the installation has been successful, close the program and use Windows Control Panel to un-install Spout.
- Choose the settings you require (use default settings if you are unsure), and click OK to save the settings into the Windows registry.

2. Seeing a missing DLL error?

The Spout utility programs are built with Visual Studio 2017. If you see errors about missing DLL's then you can install the [Visual Studio runtimes](#). Spout programs can be either 64-bit or 32-bit, so you need to install both runtimes separately. Please be sure to install the 64-bit version before the 32-bit version.

3. Shortcuts

Consider making shortcuts on your desktop to the Demo programs and SpoutSettings.

Support

Please direct any questions to the [Spout Discourse group](#).

Un-installation

If you want to remove Spout and clean the registry, use Regedit to delete :
<HKEY_CURRENT_USER\Software\Leading Edge\Spout>

Or, if there are no other Spout applications installed, use Regedit to delete :
<HKEY_CURRENT_USER\Software\Leading Edge>
